FUNNEL · YOLO MODE

How the YOLO engine works

YOLO mode hunts for mining, biotech and small-cap companies with a credible path to a 100x return. Every day it screens every US and Canadian listing in those groups, reviews the most promising in depth, scores each one 1–10, and writes down why it's there and what could go wrong. This is how.

1 Screen
All listings in 3 groups, through hard filters

2 Quick score
Size, trend, range and liquidity → top 40

3 Full review
Up to 14 traits, each scored 0–100

4 Level
Weighted score → level 1 to 10

5 Write-up
Tags, reasons and risks

The run on 2026-10-11, from 1,592 listings to 21 names at level 9–10

Speculative by design. The level is a screen, not advice. Most would-be 100-baggers go to zero: size any position so losing all of it is fine, and use Funnel's other tabs (financials, comps, the model) to check the story first.

Data: Yahoo Finance (screener, quotes and company profiles). The screen runs once a day and is kept for the day; a run that comes back incomplete is retried after ten minutes.

STEP 1

The screen

Yahoo's screener lists every listing in each of three groups (up to 1,000 per group). Each group asks for something different, so each has its own query.

1. Mining
Gold, silver, copper, uranium, platinum & other metals

→

2. Biotech
Biotechnology industry

→

3. Small caps
Any industry with quarterly revenue growth above 20%

Groups claim names in this order: a miner that also grows 20% stays a miner. A company listed twice (HSTR.TO and HSTR.V) is kept once.

Hard filters: every name has to clear all four

Market value too small to buy, or too big to 100x	**US$15M – US$2B**
Daily trading you can actually get in and out	**≥ US$75K a day**
Share price no sub-penny shells	**above 5¢**
Exchange Nasdaq, NYSE, NYSE American, TSX, TSXV, CSE, Cboe Canada · no OTC	**main US / Canadian boards**

Market values are converted to US dollars with live exchange rates, so a TSXV junior and a Nasdaq biotech are measured on the same scale. A name in a currency with no rate drops out.

Why these limits? A 100x from US$2B would make a US$200B company: possible, but rare enough that the screen leaves it to the research tabs. Below US$15M and under US$75K a day, listings are hard to buy, easy to move, and often on their way off the exchange.

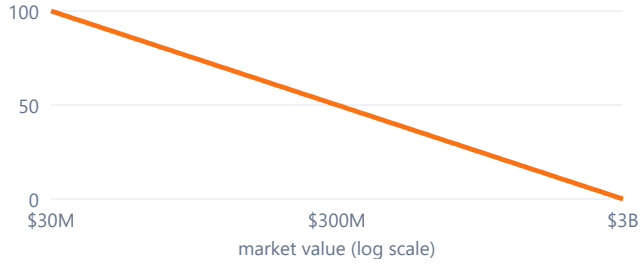

STEP 2

The quick score

A full review takes several data calls per company, so first every name that passed the filters gets a quick score from what the screener already sends. The best 40 in each group go on to the full review.

35% Room to grow	30% Trend vs 200-day average	15% Range	20% Liquidity

Room to grow

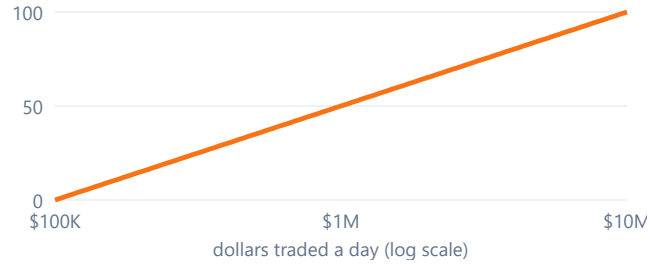

Trend vs the 200-day average

Place in the 52-week range

Liquidity

Each curve shows how a reading becomes a 0–100 score. Everything is clamped: past the right-hand end there are no extra points.

STEP 3

The full review: up to 14 traits

For each shortlisted company the engine pulls its profile, financials and ownership, then scores every trait that matters for its group from 0 to 100. Each trait also writes a sentence when it's a clear strength or a clear risk. A trait with no data counts as 40, a little below average, so gaps in the data are never rewarded. Squares under "Used by": ■ mining · ■ biotech · ■ small caps.

	TRAIT	CURVE	SCORES 0 AT	SCORES 100 AT	NOTES	USED BY
H	**Room to grow** Market value in US$		US$3B	US$30M	Log scale: smaller is better	■ ■ ■
R	**Cash runway** Cash ÷ yearly cash burn		6 months	3 years	Self-funding scores full marks	■ ■ ■
D	**Balance sheet** Net cash or net debt vs market value		Net debt = 50% of value	Net cash	Any net cash scores full marks	■ ■ ■
C	**Cash backing** Cash as a share of market value		0%	60%+	Is the science priced near zero?	■
U	**Analyst upside** Mean target vs price (2+ analysts)		0% or below	+150%	Needs at least two analysts	■ ■ ■
S	**Institutional backing** Share held by institutions		0%	60%+		■ ■ ■
I	**Insider ownership** Share held by insiders		0%	20%+	Capped at 70 above 70% held	■ ■ ■
M	**Momentum** Price vs 200-day average		−15%	+35%	×0.7 if already up 300%+ in a year	■ ■ ■
X	**Short interest** Shorted share of the float		30%+	5% or less	Less is better	■ ■ ■
L	**Liquidity** Dollars traded a day		US$100K	US$10M	Log scale	■ ■ ■
T	**Metal price trend** The metal's 1-year move		−10%	+40%	Mining only	■
B	**Asset value** Price ÷ book value		3x+	0.5x	Cheaper is better; mining only	■
V	**Producing / selling** Revenue and gross margin		None (40)	Selling well	Miners: in production · biotech: product selling	■ ■
K	**Scalable business** How cyclical the industry is		Very cyclical	Not cyclical	Small caps	■
G	**Revenue growth** Growth on a year ago		0%	+80%	Discounted by cyclicality	■
Q	**Gross margin** Gross margin		20%	70%+		■
P	**Price for the growth** EV/sales ÷ growth %		0.35+	0.05	Cheap for its growth scores high	■
F	**Path to profit** Operating cash flow ÷ revenue		−40%	0% or better	Cash-positive scores full marks	■

STEP 3, CONTINUED

What each group cares about

The same trait matters more for some companies than others. A junior miner lives on its metal and its insiders; a biotech on its cash and what analysts think the pipeline is worth; a small cap on growth it can scale. Weights are shown as each trait's share of its group's total.

	Mining	Biotech	Small caps
H · Room to grow	16%	14%	12%
R · Cash runway	12%	16%	7%
D · Balance sheet	6%	4%	2%
C · Cash backing	not used	14%	not used
U · Analyst upside	6%	16%	3%
S · Institutional backing	3%	10%	3%
I · Insider ownership	12%	6%	9%
M · Momentum	14%	10%	9%
X · Short interest	3%	5%	2%
L · Liquidity	3%	2%	2%
T · Metal price trend	10%	not used	not used
B · Asset value	10%	not used	not used
V · Producing / selling	8%	5%	not used
K · Scalable business	not used	not used	12%
G · Revenue growth	not used	not used	16%
Q · Gross margin	not used	not used	9%
P · Price for the growth	not used	not used	9%
F · Path to profit	not used	not used	7%

Special rules

- Insiders above 70% cap the score at 70: control that tight cuts both ways.
- Momentum is cut by 30% if the shares are already up 300%+ in a year.
- Revenue growth is discounted by how cyclical the industry is: oil, shipping or metals growth is mostly the cycle.
- Small-cap banks, insurers, REITs, utilities, asset managers and shells are left out: they don't compound to 100x.
- A company whose industry is Biotechnology or a mining industry joins that group, wherever it was found.

Where the numbers come from

- Cash, debt, revenue, cash flow and margins: Yahoo's financial data, converted to the trading currency.
- Ownership and short interest: Yahoo's key statistics.
- Analyst targets: Yahoo's consensus (needs 2+ analysts).
- Metal trends: the 1-year move of gold, silver, copper and platinum futures, and the URA uranium ETF.
- Cyclicality: Funnel's industry profiles (the same ones the DCF uses).

STEP 4

From score to level

The weighted average of the trait scores is the company's score out of 100. Two adjustments, then fixed cuts turn it into a level from 1 (not very promising) to 10 (very promising).

Σ weight × trait score
÷ total weight × 100

→

Runway under 6 months?
× 0.8 (a raise is near-certain)

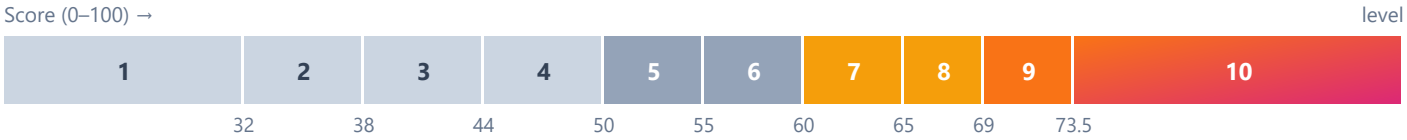

→

Mining?
+6 (juniors rarely have analysts or revenue)

→

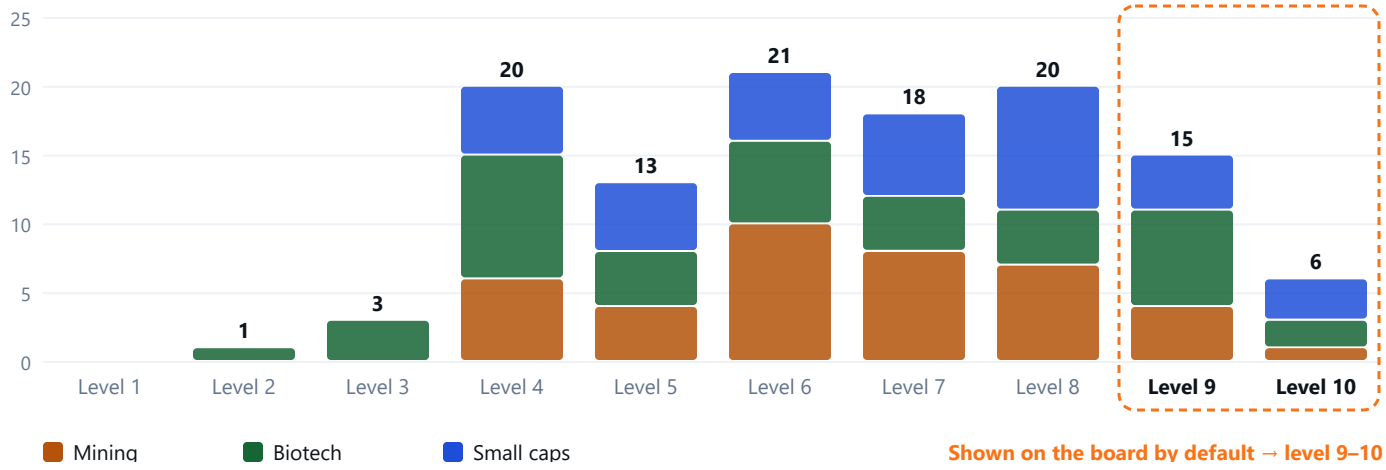

Fixed level cuts
a 9 means the same every day

The level cuts

The cuts never move with the day's results, so a 9 means the same thing every day: some days there are many, some days none. Mining's +6 makes a 9 about as rare in each group.

How the 117 reviewed names landed on 2026-10-11

STEP 5

The write-up, and a worked example

Every pick comes with its reasons. Nothing is written by hand: each sentence comes from a trait that scored clearly high or clearly low.

Tags — up to three, from the traits scoring 70+, strongest first (weight × score).
Why it's here — up to four strengths, ordered by weight × score.
What could go wrong — up to three risks, ordered by weight × how far the trait fell short. If fewer than two, the group's standing risk is added (biotech: binary trial readouts; mining: metal prices, permits, financing; small caps: one lost customer or a funding squeeze).

On the board, picks are sortable by level, industry and market value, filterable by group, and only 9s and 10s show by default.
In a company's YOLO rationale tab (YOLO mode only), the same write-up appears with the full score breakdown. A company that isn't on today's board is scored on the spot by the same review, with the reasons it didn't make the board (too big, too thinly traded, not growing 20%…).

10 Palisades Goldcorp Ltd. (PALI.V) · Mining · Gold · score 75.9

Momentum · Years of cash · Insider-owned

Momentum	weight 14% · scores 100	+13.6
Insider ownership	weight 12% · scores 100	+11.7
In production	weight 8% · scores 100	+7.8
Asset value	weight 10% · scores 51	+5.0
Analyst upside	weight 6% · missing → 40	+2.3
Liquidity	weight 3% · scores 6	+0.2
Mining calibration		+6.0
Cash runway	weight 12% · scores 100	+11.7
Room to grow	weight 16% · scores 54	+8.4
Balance sheet	weight 6% · scores 100	+5.8
Metal price trend	weight 10% · scores 24	+2.3
Short interest	weight 3% · missing → 40	+1.2
Institutional backing	weight 3% · scores 0	+0.0

Why it's here

+ Trading 52% above its 200-day average: the market is starting to notice.
+ C$183M of cash covers more than 10 years of spending at the current burn (C$8M a year).
+ Insiders own 47%: management only gets rich if shareholders do.
+ Worth C$352M today, so even a 100x (C$35.2B) would leave it smaller than the biggest names in its field.

What could go wrong

– Thinly traded (about $133K a day): hard to buy or sell size without moving the price.
– Miners live on metal prices, permits and financing; a falling metal or a failed raise hits juniors hardest.

Example from the 2026-10-11 run. Each bar segment is a trait's points: its 0–100 score times its share of the weight. Analyst upside and short interest had no data and count as 40. The hatched segment is the +6 mining calibration. Figures change daily.
